Sets: Medical Testing Example

Video companion

1 Example using set theory

```
VBS: "very bad syndrome"
```

X = set of people in a clinical trial

$$S = \{x \in X : x \text{ has VBS}\}$$

$$H = \{x \in X : x \text{ does not have VBS}\}$$

$$X = S \cup H$$
 (you either have VBS or you don't)
 $S \cap H = \emptyset$ (no one both has and doesn't have it)

Point of medial testing to figure out whether a person is in S or in H

2 Test

```
P = \{x \in X : x \text{ tests positive for VBS}\}

N = \{x \in X : x \text{ tests negative for VBS}\}

P \cup N = X (you either test positive or negative)

P \cap N = \emptyset (no one tests both positive and negative)
```

In a perfect world, S would equal P—the sick people would always test positive, and H would equal N—the healthy people would always test negative.

...but this is not always the case.

$S \cap P$	$H \cap N$	$S\cap N$	$H \cap P$
true positive	true negative	false negative	false positive

3 Cardinality

 $\frac{|S|}{|X|}$ = proportion of people in the study who do genuinely have VBS $\frac{|B|}{|X|}$ = proportion of people in the study without VBS

 $\frac{|S|}{|X|} + \frac{|H|}{|X|} = 1$

 $\begin{array}{c|c} |\frac{S\cap P}{|S|} & \text{true positive rate} & \text{would like to be close to 1} \\ \frac{|H\cap P|}{|H|} & \text{false positive rate} & \text{would like to be as small as possible} \\ \frac{|S\cap N|}{|S|} & \text{false negative rate} & \text{would like to be as small as possible} \\ \frac{|H\cap N|}{|H|} & \text{true negative rate} & \text{would like to be close to 1} \\ \end{array}$
